Outline

- Roadmap
- Hardware
- Software
- Application

Overview of TH Roadmap

Roadmap

- 12-FiveY project (-2015)
 - System
 - 100P
 - funding
 - MOST (863)
 - Local government
 - Software(year 2011)
 - NSFC 37 million for basic algorithm and computable model
 - MOST(863) 80 million for Domain applications
- 13-FiveY project (-2020)
 - ~ 1 E
 - Funding ?

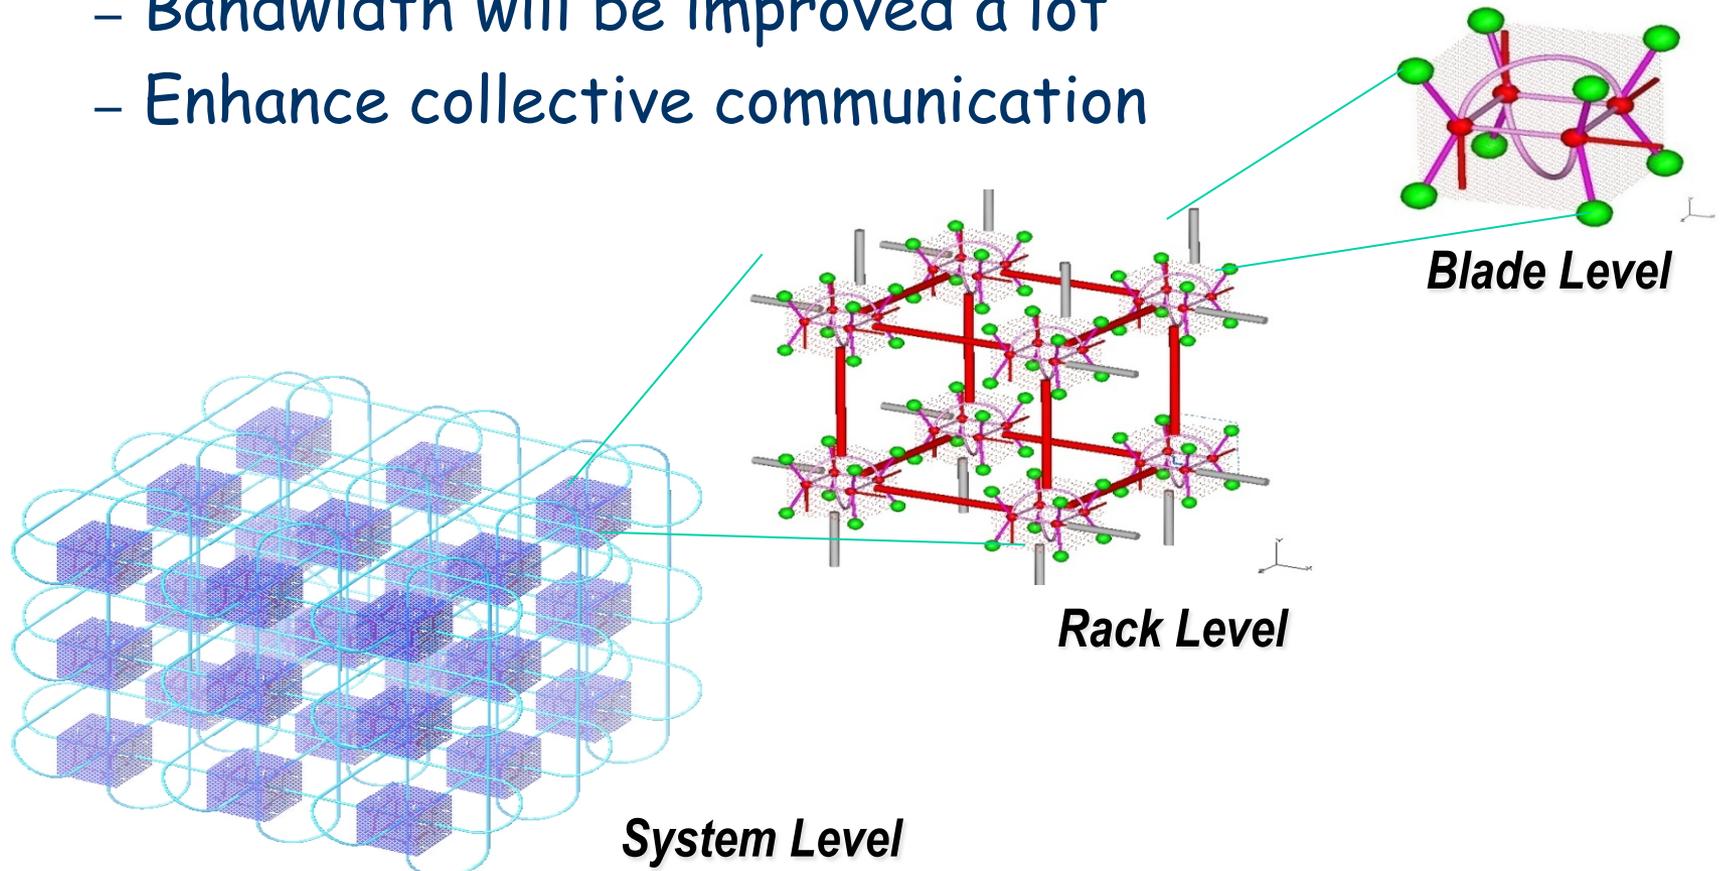

Highlights of future TH systems

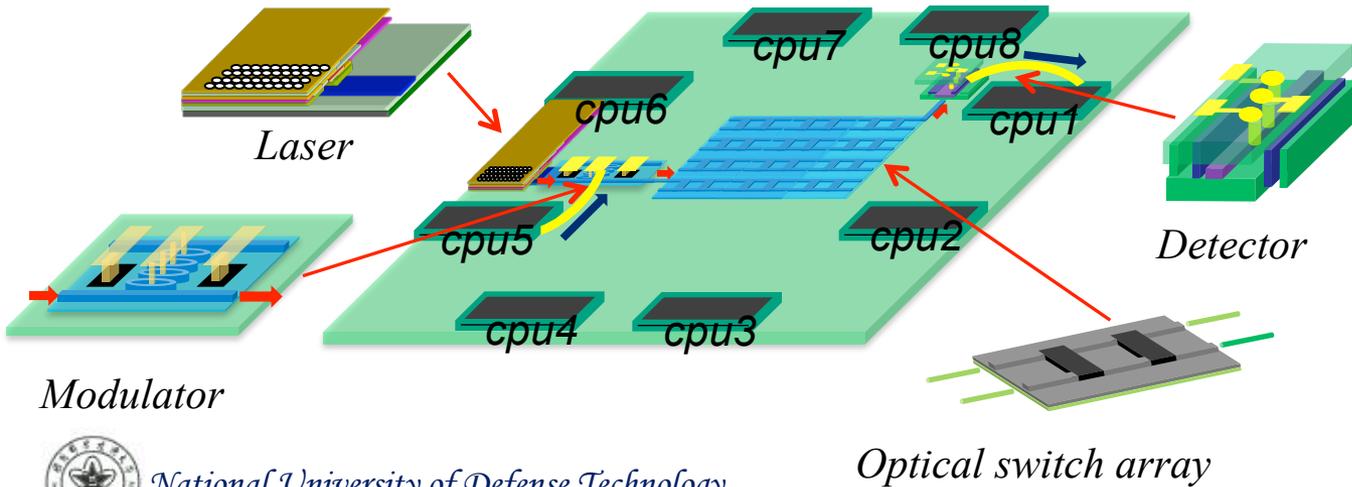

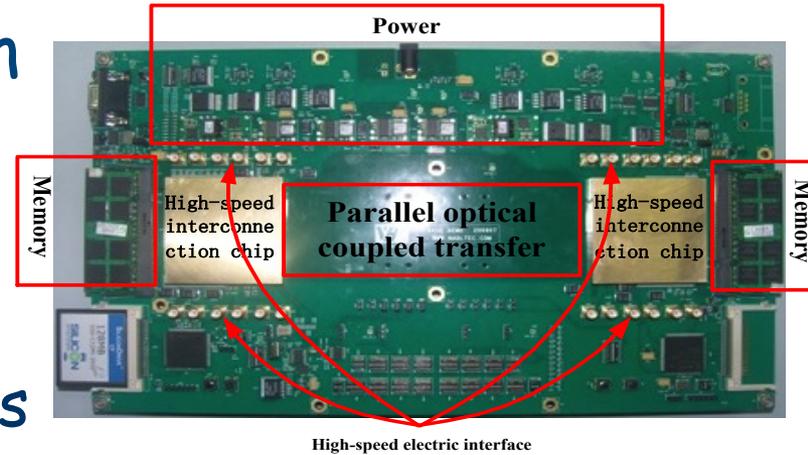

- Heterogeneous parallel architecture
- Multiple-dimension interconnection network
- Hierarchy I/O storage system
- Autonomic fault tolerant management
- Domain specific programming framework
- Adaptive power aware computing

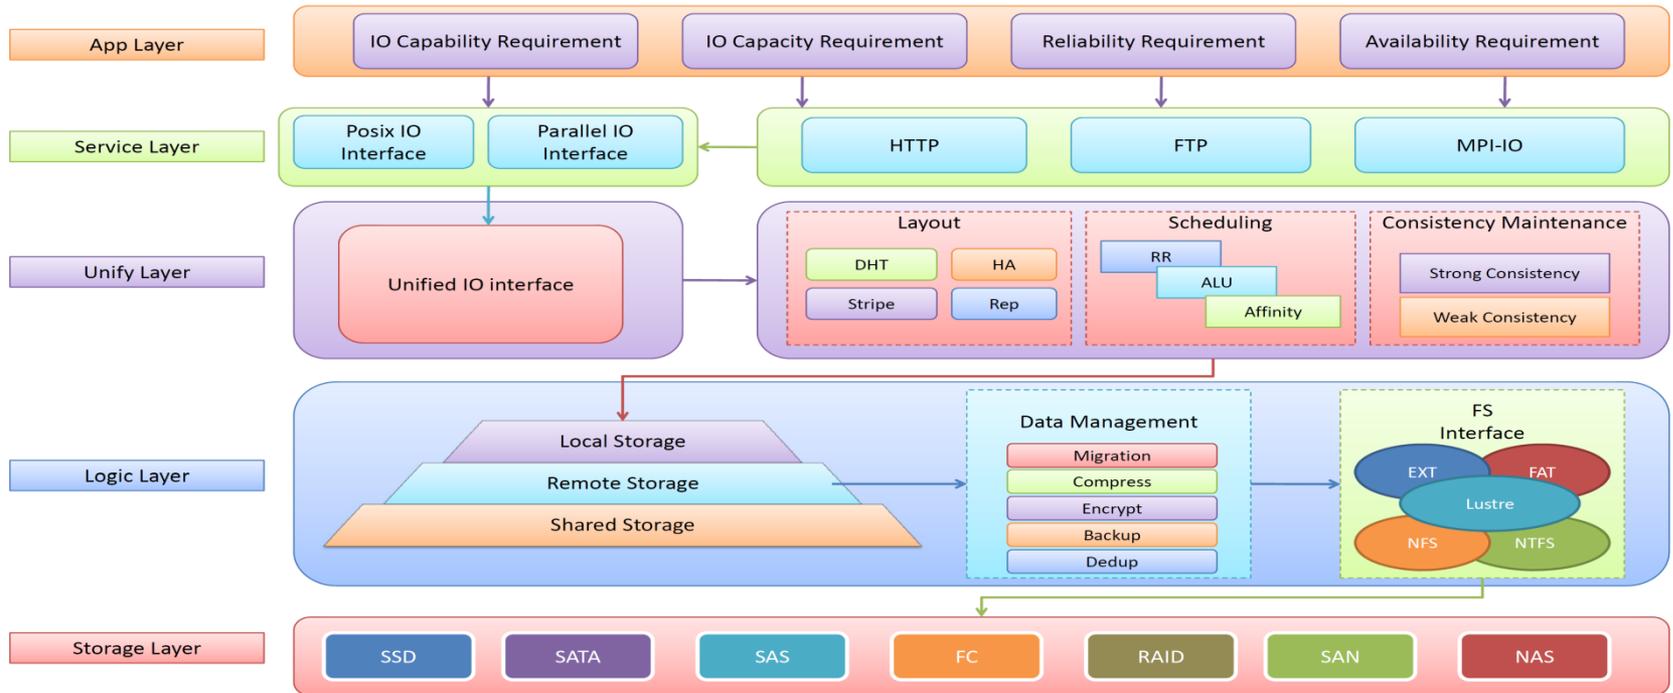

- Multiple-dimension interconnection network
 - Support more than 100,000 nodes
 - Bandwidth will be improved a lot
 - Enhance collective communication

- Inter-chip optical connection
 - Optical interface between processors
 - Optical switch between CPUs is under research

Large-scale Hybrid Tiered File System

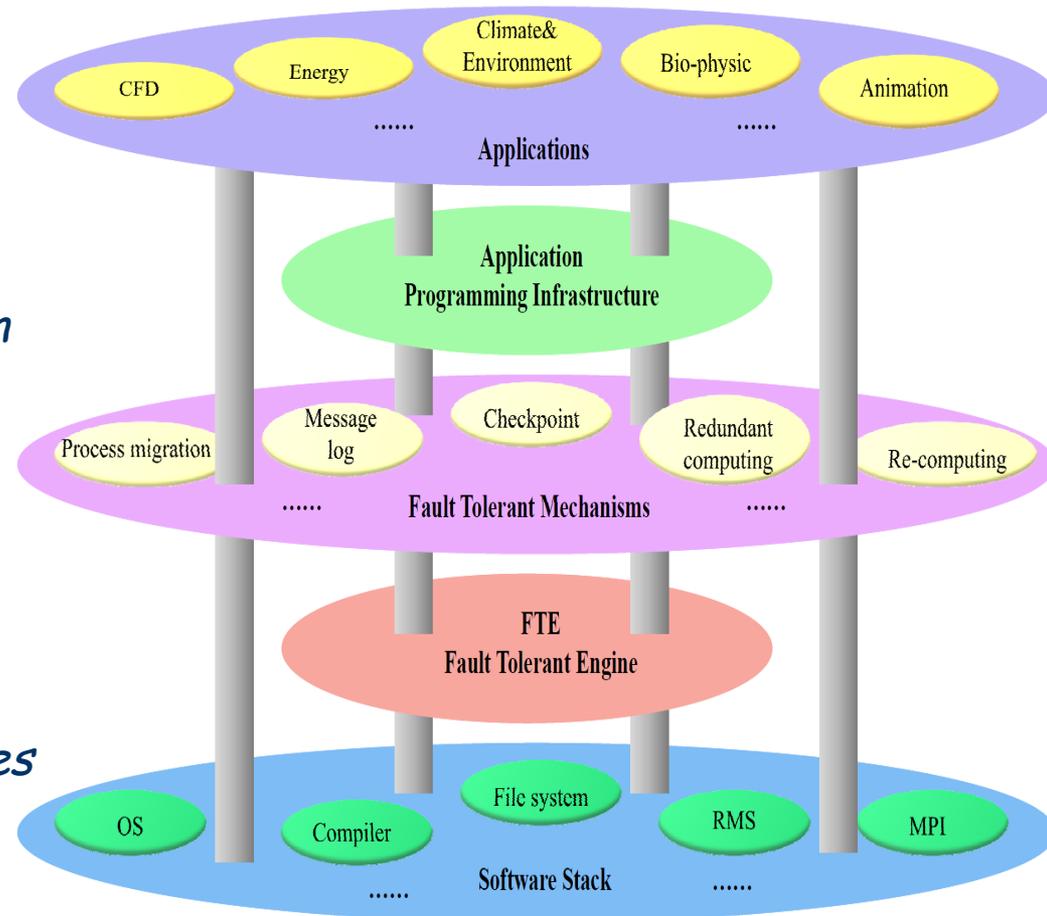

- Scalability to achieve $>1\text{TB/s}$ I/O bandwidth by leveraging spatial locality
- Usability by federating multi-level storage into unified name space
- Flexibility by key components re-configuration for application optimization
- Applicability for supercomputers and clusters with hybrid infrastructure

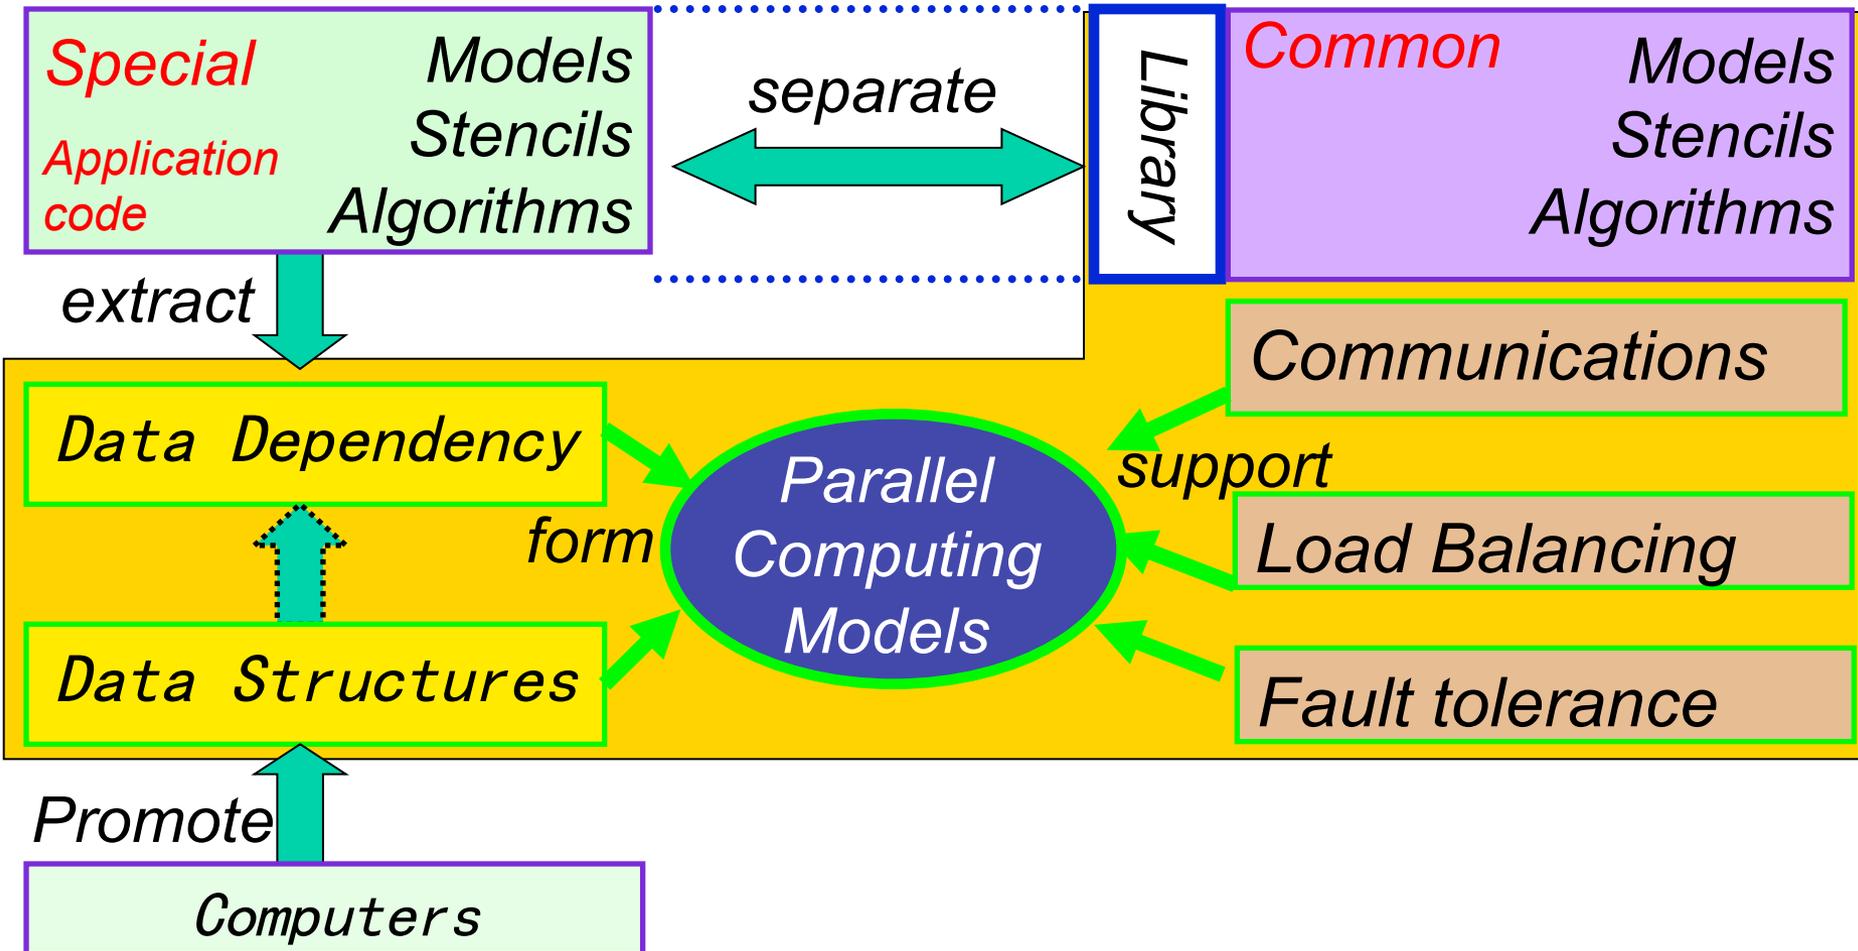

Resilience computing Framework

- *Capability to support post-petaflops and Exascale computing*
- *Collaboration with whole system software stack*
- *Coherent fault detection*
- *Coordinate fault tolerant decision*
- *Cooperation of multiple fault recovery mechanics*
- *Combination of proactive and reactive strategies*
- *Customizable fault detection, prediction and recovery approaches*
- *Support various parallel models*

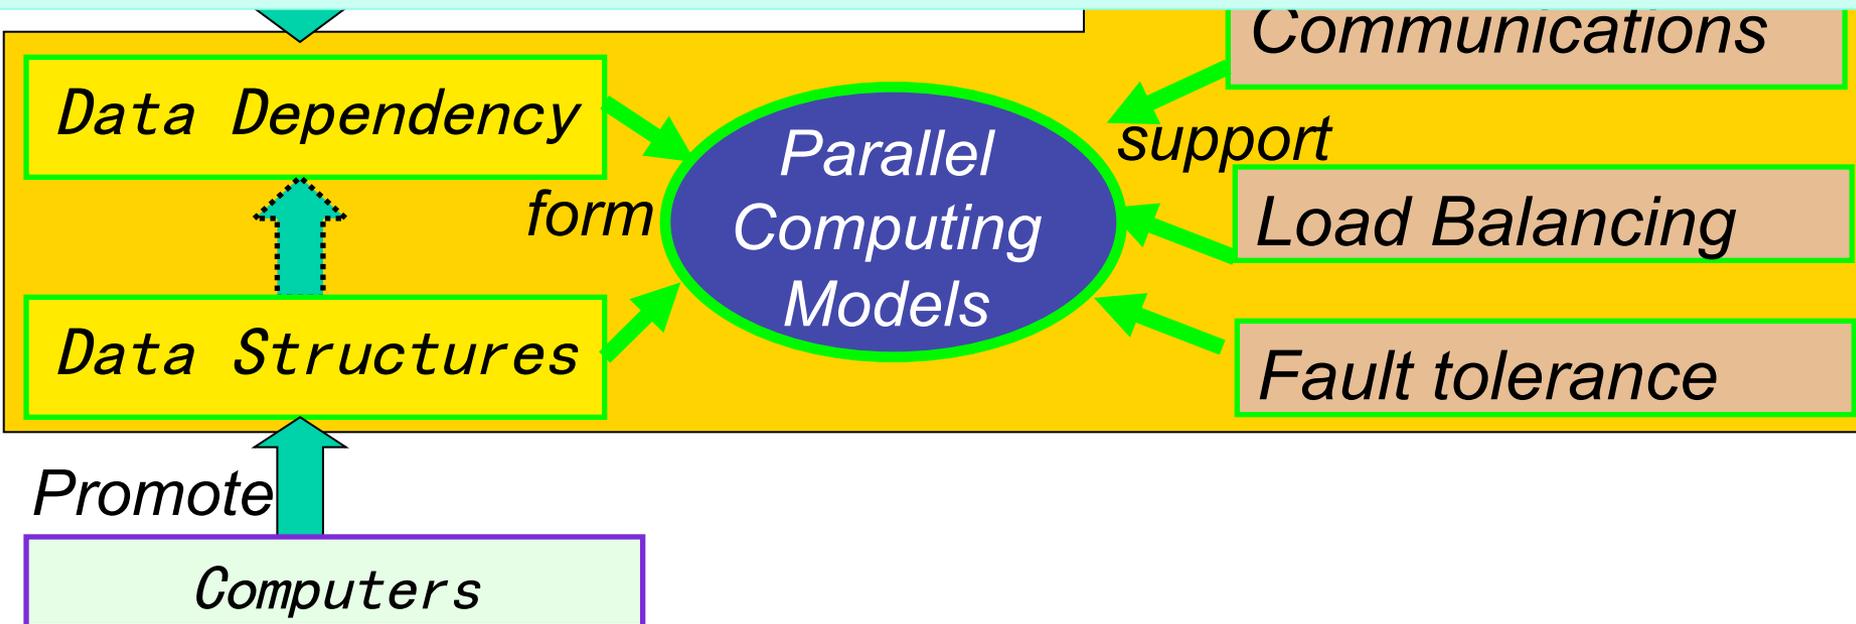

Parallel programming Framework

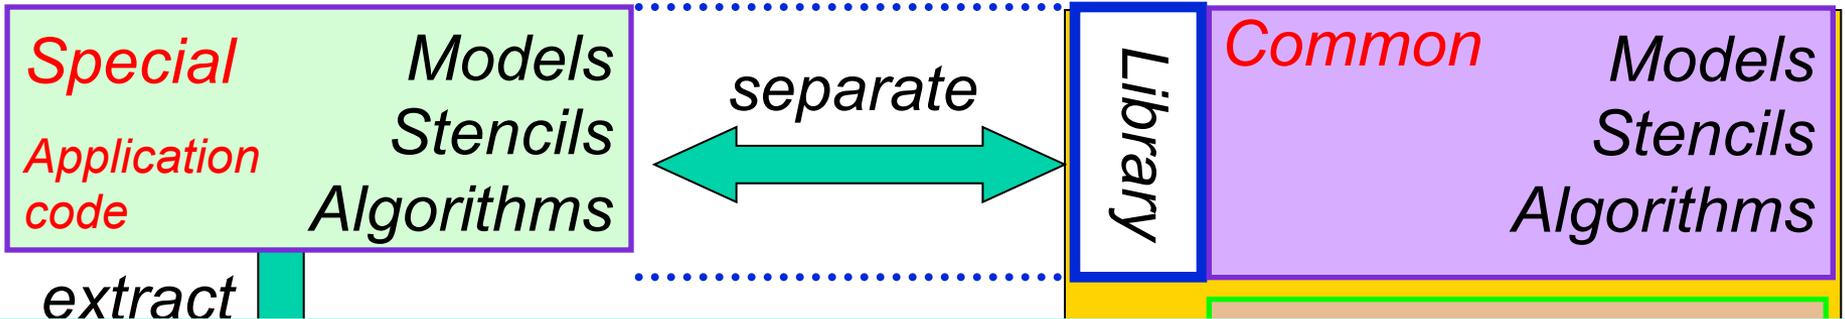

Parallel programming Framework

Hide the complexity of programming(mil cores/hybrid)
Integrate the efficient parallel fast numerical algorithms
Provide efficient data structures and solver libraries
Support software engineering for code reusing

USERS

Parallel programming Framework

Optimization interface
Heterogeneous issues
Communication organization
Load balance
Fault tolerance

System software developers

Promote

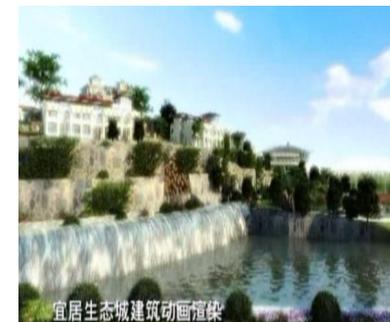

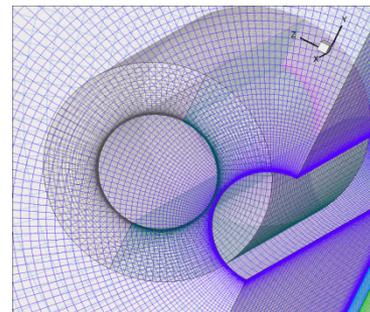

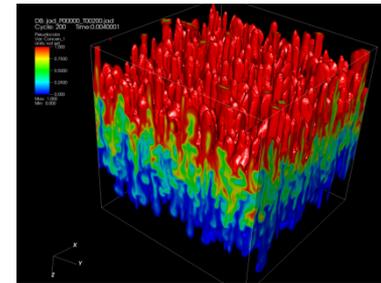

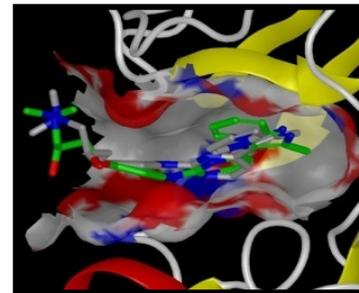

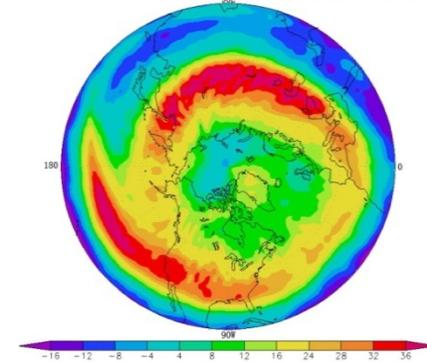

Computers

Applications

- Five priority areas
 - Climate & Environment
 - Bio-medicine
 - New energy
 - Equipment engineering
 - Animation

NPS 10hPa zonal wind(unit: m/s) at 2009032000

Summary

- Towards Next generation of TH system
 - Heterogeneous architecture
 - New enabling technology
 - High performance scalable interconnection
 - Balance the computing and data accessing
 - Feasible fault tolerant mechanics
 - Usable domain-specific programming framework
 - Selected priority application areas

Thank you
